EXPLORATORY: does the gate's uncertainty signal anticipate cost?
SafetyPointGoal1, final snapshot, 10 held-out episodes per run; points = pooled AUROC, bars = 95% seed-cluster bootstrap
ratio = sqrt(Q_eu)/|Q_bar|
sqrt(Q_eu)
Q_c
-Q_bar
chance (0.5 = no anticipation)
cost within the next k = 10 steps
cost within the next k = 50 steps
